<i>Foreword</i>	(vii)
<i>Preface to Second Edition</i>	(ix)
<i>Preface to First Edition</i>	(xi)
<i>Acknowledgements</i>	(xiii)

Chapter 1

Introduction **1-38**

1.1 Design and Analysis of a Component	1
1.2 Approximate Method vs. Exact Method	5
1.3 Weighted Residual Methods	6
1.4 Variational Method or Rayleigh – Ritz Method	13
1.5 Principle of Minimum Potential Energy	24
1.6 Origin of FEM	28
1.7 Principle of FEM	29
1.8 Classification of FEM	33
1.9 Types of Analyses	34
1.10 Basic Steps in FEA	34
1.11 Summary	35
<i>Objective Questions</i>	36

Chapter 2

Matrix Operations **39-66**

2.1 Types of Matrices	39
2.2 Matrix Algebra	41
2.3 Determinant	43

2.4	Inversion of a Matrix	45
2.5	Methods of Solution of Simultaneous Equations	45
2.5.1	By Inversion of the Coefficient Matrix	46
2.5.2	Direct Methods	49
2.5.3	Iterative Methods	58
2.6	Eigen Values and Eigen Vectors	60
2.7	Matrix Inversion Through Characteristic Equation	63
2.8	Summary	65

Chapter 3

Theory of Elasticity **67-90**

3.1	Degrees of Freedom	67
3.2	Rigid Body Motion	68
3.3	Discrete Structures	68
3.4	Continuum Structures	68
3.5	Material Properties	69
3.6	Linear Analysis	69
3.7	Non-linear Analysis	69
3.8	Stiffness and Flexibility	70
3.9	Principle of Minimum Potential Energy	71
3.10	Stress and Strain at a Point	71
3.11	Principal Stresses	74
3.12	Mohr's Circle for Representation of 2-D Stresses	75
3.13	VonMises Stress	78
3.14	Theory of Elasticity	79
3.15	Summary	89

Chapter 4

Discrete (1-D) Elements **91-136**

4.1	Degrees of Freedom of Different Elements	91
4.2	Calculation of Stiffness Matrix by Direct Method	92

4.3	Calculation of Stiffness Matrix by Variational Principle	94
4.4	Transformation Matrix	98
4.5	Assembling Element Stiffness Matrices	101
4.6	Boundary Conditions	102
4.7	Beam Element Stiffness Matrix by Variational Approach	105
4.8	General Beam Element	107
4.9	Pipe Element	110
4.10	Frontal Solution	110
4.11	Summary	111
	Objective Questions	112
	Solved Problems	115
Chapter 5		
Continuum (2-D & 3-D) Elements		137-168
5.1	2-D Elements Subjected to In-plane Loads	137
5.2	Simplex, Complex and Multiplex Elements	138
5.3	Stiffness Matrix of a CST Element	139
5.3.1	Stiffness Matrix of Right Angled Triangle	141
5.4	Convergence Conditions	143
5.5	Geometric Isotropy	146
5.6	Aspect Ratio	148
5.7	Inter-Element Compatibility	149
5.8	2-D Elements Subjected to Bending Loads	151
5.9	3-D Elements	153
5.10	Axi-symmetric Elements	154
5.11	Summary	156
	Objective Questions	157
	Solved Problems	162

Chapter 6**Higher Order and Isoparametric Elements 169-210**

6.1 Higher Order Elements	169
6.2 Isoparametric Elements	179
6.3 Stiffness Matrices of Some Isoparametric Elements	180
6.4 Jacobian	193
6.5 Strain-displacement Relations	194
6.6 Summary	198

Objective Questions 199

Solved Problems 200

Chapter 7**Factors Influencing Solution 211-248**

7.1 Distributed Loads	211
7.2 Statically Equivalent Loads vs. Consistent Loads	212
7.3 Consistent Loads for a Few Common Cases	216
7.4 Assembling Element Stiffness Matrices	219
7.5 Automatic Mesh Generation	224
7.6 Optimum Mesh Model	225
7.7 Gaussian Points & Numerical Integration	226
7.8 Modelling Techniques	230
7.9 Boundary Conditions for Continuum Analysis	235
7.10 Transition Element	239
7.11 Substructuring or Super Element Approach	241
7.12 Deformed and Undeformed Plots	242
7.13 Summary	243

Objective Questions 244

Chapter 8

Dynamic Analysis (Undamped Free Vibrations) 249-266

8.1 Normalisation of Eigenvectors	251
8.2 Modelling for Dynamic Analysis	252
8.3 Mass Matrix	252
8.4 Summary	263

Objective Questions 264

Chapter 9

Steady State Heat Conduction 267-286

9.1 Governing Equation	267
9.2 1-D Heat Conduction	269
9.2.1 Heat Conduction through a Wall	270
9.2.2 Heat Transfer through a Fin	277
9.3 2-D heat Conduction in a Plate	282
9.4 Summary	285

Objective Questions 285

Chapter 10

Design Validation and Other Types of Analysis 287-308

10.1 Design Validation	287
10.1.1 Ductile and Brittle materials	287
10.1.2 Theories of Failure	288
10.2 Compliance with Design Codes	289
10.3 Transient Heat Conduction	293
10.4 Buckling of Columns	294
10.5 Fatigue Analysis	296
10.6 Creep Analysis	298
10.7 Crack Tip Element & Fracture Mechanics	299
10.8 Contact or Gap Elements	300

10.9	Damped Free Vibration	302
10.10	Forced Vibration	305
10.10.1	Mode Superposition Method	304
10.10.2	Harmonic Response Analysis	305
10.10.3	Time-History Analysis	305
10.10.4	Response Spectrum Analysis	305
10.11	Torsion of a Non-circular Bar	305
 Chapter 11		
Computational Fluid Dynamics		309-324
11.1	Introduction	309
11.2	Governing Equations	310
11.3	Finite Difference Method (FDM)	312
11.4	Elliptic Equations (or Boundary Value Problems)	313
11.5	Finite Volume Method (FVM)	321
11.6	FDM vs. FEM	323
 Chapter 12		
Practical Analysis Using a Software		325-358
12.1	Using a General Purpose Software	325
12.2	Common Mistakes And Checking The Data	327
12.2.1	Common Data Mistakes	328
12.2.2	Checks Usually Carried out by A FEM Software	328
12.2.3	Checks To Be Carried Out By Analyst	329
12.2.4	Checks To Be Carried Out On Results	329
12.3	Some Examples with ANSYS	330
Objective Questions		354
Answers		359
References for Additional Reading		361
Index		363
